ABSTRACT

In this paper, we prove the conjecture that the four star $K_{1,1} \cup K_{1,1} \cup K_{1,m} \cup K_{1,n}$ is a skolem mean graph if $|m-n| < 7$ for $m-6 \le n \le m$ and $1 \le m \ge n$.

Keywords: *Skolem mean graph and star.*

1. INTRODUCTION

All graphs in this chapter are finite, simple and undirected. Terms not defined here are used in the sense of Harary **[8]**. In **[2]**, we proved that the three star $K_{1,\ell} \cup K_{1,m} \cup K_{1,n}$ is a skolem mean graph if $|m-n| = 4+\ell$ for $\ell = 1, 2, 3, \ldots$, $m = 1, 2, 3, \ldots$, $n = \ell + m + 4$ and $\ell \le m < n$; the three star $K_{1,\ell} \cup K_{1,m} \cup K_{1,n}$ is not a skolem mean graph if $|m-n| > 4+\ell$ for $\ell = 1, 2, 3, \ldots$, $m = 1, 2, 3, \ldots$, $n \ge \ell + m + 5$ and $\ell \le m < n$; the four star $K_{1,\ell} \cup K_{1,\ell} \cup K_{1,m} \cup K_{1,n}$ is a skolem mean graph if $|m-n| = 4+2\ell$ for $\ell = 2, 3, 4, \ldots$, $m = 2, 3, 4, \ldots$, $n = 2\ell + m + 4$ and $\ell \le m < n$; the four star $K_{1,\ell} \cup K_{1,\ell} \cup K_{1,m} \cup K_{1,n}$ is not a skolem mean graph if $|m-n| > 4+2\ell$ for $\ell = 2, 3, 4, \ldots$, $m = 2, 3, 4, \ldots$, $n = 2\ell + m + 5$ and $\ell \le m < n$; the four star $K_{1,1} \cup K_{1,1} \cup K_{1,m} \cup K_{1,n}$ is a skolem mean graph if $|m-n| = 7$ for $m = 1, 2, 3, \ldots$, $n = m + 7$ and $1 \le m < n$. Also, the four star $K_{1,1} \cup K_{1,1} \cup K_{1,m} \cup K_{1,n}$ is not a skolem mean graph if $|m-n| > 7$ for $m = 1, 2, 3, \ldots$, $n \ge m + 8$ and $1 \le m < n$. **In [3]**, the necessary condition for a graph to be skolem mean is that $p \ge q+1$.

2. SKOLEM MEAN LABELING

Definition 2.1: The four star is the disjoint union of $K_{1,a}$, $K_{1,b}$, $K_{1,c}$ and $K_{1,d}$. It is denoted by $K_{1,a} \cup K_{1,b} \cup K_{1,c} \cup K_{1,d}$.

***Corresponding Author: V. Balaji*[4]**
[1, 3]Department of Mathematics, Sacred Heart College, Tirupattur - 635 601, India.

Definition 2.2 [2]: A graph $G=(V,\ E)$ with p vertices and q edges is said to be a skolem mean graph if there exists a function f from the vertex set of G to $\{1,2,3,...,p\}$ such that the induced map f* from the edge set of G to $\{2,3,4,...,p\}$ defined by

$$f^*(e=uv)=\begin{cases} \dfrac{f(u)+f(v)}{2} & if\ f(u)+f(v)\ is\ even \\ \dfrac{f(u)+f(v)+1}{2} & if\ f(u)+f(v)\ is\ odd,\ then \end{cases}$$

the resulting edges get distinct labels from the set $\{2,3,4,...,p\}$.

Note 2.3: In a skolem mean graph, $p\geq q+1$.

Theorem 2.4: If $1\leq m\geq n,$ the four star $K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ is a skolem mean graph if $|m-n|<7$ for $n=1,2,3,...$ and $m-6\leq n\leq m$.

Proof:

Case (a) Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,...$. we have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\leq i\leq m\}\cup\{x_j:1\leq j\leq n\}$ and

$$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\leq i\leq m\}\cup\{xx_j:1\leq j\leq n\}.$$

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f:V(G)\rightarrow\{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=5;\ f(w)=m+n+5;\ f(x)=3;$$
$$f(u_1)=9;$$
$$f(v_1)=7;$$
$$f(w_i)=2i \qquad for\ 1\leq i\leq m;$$
$$f(x_j)=2j+9\ \ for\ 1\leq j\leq n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 5 ; vv_1 is 6 ; ww_i is $\dfrac{m+n+2i+5}{2}$ for $1\leq i\leq m$ and xx_j is $j+6$ for $1\leq j\leq n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(b): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-1.$ Let us consider the case that $|m-n|<7$ for $n=1,2,3,...$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\leq i\leq m\}\cup\{x_j:1\leq j\leq n\}$.

$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\leq i\leq m\}\cup\{xx_j:1\leq j\leq n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f: V(G) \rightarrow \{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=2;\ f(w)=m+n+5;\ f(x)=4;$$
$$f(u_1)=6;$$
$$f(v_1)=8;$$
$$f(w_i)=2i+1 \quad for\, 1\le i\le m;$$
$$f(x_j)=2j+8 \quad for\, 1\le j\le n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 4 ; vv_1 is 5 ; ww_i is $\dfrac{m+n+2i+6}{2}$ for $1\le i\le m$ and xx_j is $j+6$ for $1\le j\le n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(c): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-2$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,\ldots$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\le i\le m\}\cup\{x_j:1\le j\le n\}$.

$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\le i\le m\}\cup\{xx_j:1\le j\le n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f: V(G) \rightarrow \{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=3;\ f(w)=m+n+5;\ f(x)=5;$$
$$f(u_1)=2;$$
$$f(v_1)=7;$$
$$f(w_i)=2i+2 \quad for\, 1\le i\le m;$$
$$f(x_j)=2j+7 \quad for\, 1\le j\le n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 2 ; vv_1 is 5 ; ww_i is $\dfrac{m+n+2i+7}{2}$ for $1\le i\le m$ and xx_j is $j+6$ for $1\le j\le n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(d): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-3$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,\ldots$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\le i\le m\}\cup\{x_j:1\le j\le n\}$.

$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\le i\le m\}\cup\{xx_j:1\le j\le n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f:V(G)\rightarrow\{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=2;\ f(w)=m+n+5;\ f(x)=6;$$
$$f(u_1)=3;$$
$$f(v_1)=4;$$
$$f(w_i)=2i+3 \quad for 1\leq i\leq m;$$
$$f(x_j)=2j+6 \quad for 1\leq j\leq n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 2 ; vv_1 is 3; ww_i is $\frac{m+n+2i+8}{2}$ for $1\leq i\leq m$ and xx_j is $j+6$ for $1\leq j\leq n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(e): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-4$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,...$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\leq i\leq m\}\cup\{x_j:1\leq j\leq n\}$.

$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\leq i\leq m\}\cup\{xx_j:1\leq j\leq n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f:V(G)\rightarrow\{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=2;\ f(w)=m+n+5;\ f(x)=5;$$
$$f(u_1)=3;$$
$$f(v_1)=4;$$
$$f(w_i)=2i+4 \quad for 1\leq i\leq m;$$
$$f(x_j)=2j+5 \quad for 1\leq j\leq n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 2 ; vv_1 is 3 ; ww_i is $\frac{m+n+2i+9}{2}$ for $1\leq i\leq m$ and xx_j is $j+5$ for $1\leq j\leq n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(f): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-5$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,...$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\le i\le m\}\cup\{x_j:1\le j\le n\}$.
$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\le i\le m\}\cup\{xx_j:1\le j\le n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges. The required vertex labeling $f:V(G)\to\{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=2;\ f(w)=m+n+5;\ f(x)=5;$$
$$f(u_1)=3;$$
$$f(v_1)=4;$$
$$f(w_i)=2i+5 \quad for\ 1\le i\le m;$$
$$f(x_j)=2j+4 \quad for\ 1\le j\le n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 2; vv_1 is 3 ; ww_i is $\dfrac{m+n+2i+10}{2}$ for $1\le i\le m$ and xx_j is $j+5$ for $1\le j\le n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.

Case-(g): Consider the graph $G=K_{1,1}\cup K_{1,1}\cup K_{1,m}\cup K_{1,n}$ when $n=m-6$. Let us consider the case that $|m-n|<7$ for $n=1,2,3,...$. We have to prove that G is a skolem mean graph.

We have $V(G)=\{u,u_1\},\{v,v_1\},\{w\}\cup\{w_i:1\le i\le m\}\cup\{x_j:1\le j\le n\}$.
$E(G)=\{uu_1,vv_1\}\cup\{ww_i:1\le i\le m\}\cup\{xx_j:1\le j\le n\}$.

Then G has $m+n+6$ vertices and $m+n+2$ edges.

The required vertex labeling $f:V(G)\to\{1,2,3,4,...,m+n+6\}$ is defined as follows:

$$f(u)=1;\ f(v)=2;\ f(w)=m+n+5;\ f(x)=6;$$
$$f(u_1)=3;$$
$$f(v_1)=4;$$
$$f(w_i)=2i+6 \quad for\ 1\le i\le m;$$
$$f(x_j)=2j+3 \quad for\ 1\le j\le n$$

The corresponding edge labels are as follows:

The edge label of uu_1 is 2 ; vv_1 is 3 ; ww_i is $\dfrac{m+n+2i+11}{2}$ for $1\le i\le m$ and xx_j is $j+5$ for $1\le j\le n$.

Hence the induced edge labels of G are distinct.

Hence the graph G is skolem mean graph.
