ABSTRACT

The aim of this paper is to introduce and study the concepts of slightly  $\alpha g$ -open, slightly  $\alpha g$ -closed, almost slightly  $\alpha g$ -open and almost slightly  $\alpha g$ -closed mappings and the interrelationship between other slightly-open and slightly closed maps.

**Keywords:**  $\alpha g$ -open set,  $\alpha g$ -open map,  $\alpha g$ -closed map, slightly-closed map, slightly  $\alpha$ -open map, slightly  $\alpha$ -closed map, slightly  $\alpha g$ -open, slightly  $\alpha g$ -closed, almost slightly  $\alpha g$ -open and almost slightly  $\alpha g$ -closed map.

**AMS Classification:** 54C10, 54C08, 54C05.

1. INTRODUCTION

Mappings plays an important role in the study of modern mathematics, especially in Topology and Functional analysis. Open mappings are one such which are studied for different types of open sets by various mathematicians for the past many years. The first Author of the present paper studied slightly open and slightly closed mappings, slightly semi-open and slightly semi-closed mappings, slightly pre-open and slightly pre-closed mappings in the year 2013. S. Balasubramanian, C. Sandhya and P.A.S. Vyjayanthi studied slightly  $v$ -open mappings in the year 2013. S. Balasubramanian and C. Sandhya studied slightly  $\beta$ -open and slightly  $\beta$ -closed mappings in the year 2013. Recently in the year 2014 S. Balasubramanian, P.A.S. Vyjaanathi and C. Sandhya studied slightly  $v$ -closed mappings. Inspired with these developments we introduce in this paper a new variety of almost slightly open and closed mappings called slightly  $\alpha g$ -open, almost slightly  $\alpha g$ -open, slightly  $\alpha g$ -closed and almost slightly  $\alpha g$ -closed mappings and study its basic properties; interrelation with other type of such mappings available in the literature. Throughout the paper  $X, Y$  means topological spaces  $(X, \tau)$  and  $(Y, \sigma)$  on which no separation axioms are assured.

2. PRELIMINARIES

**Definition 2.1:**  $A \subseteq X$  is said to be

- a) regular open [ $\alpha$ -open] if  $A = \text{int}(\text{cl}(A))$  [ $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ ] and regular closed [ $\alpha$ -closed] if  $A = \text{cl}(\text{int}(A))$  [ $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ ]
- b)  $g$ -closed [ $rg$ -closed,  $\alpha g$ -closed] if  $\text{cl}(A) \subset U$  [ $\text{rcl}(A) \subset U$ ,  $\alpha\text{-cl}(A) \subset U$ ] whenever  $A \subset U$  and  $U$  is open [ $r$ -open,  $\alpha$ -open] in  $X$  and  $g$ -open [ $rg$ -open,  $\alpha g$ -open] if its complement  $X - A$  is  $g$ -closed [ $rg$ -closed,  $\alpha g$ -closed].

**Remark 1:** We have the following implication diagrams for closed sets.

The same relation is true for open sets also.

**\*Corresponding Author: S. Balasubramanian\***

**Definition 2.2:** A function  $f: X \rightarrow Y$  is said to be

1. continuous [resp: r-continuous,  $\alpha$ -continuous] if the inverse image of every open set is open [resp: r-open,  $\alpha$ -open].
2. r-irresolute [resp:  $\alpha$ -irresolute] if the inverse image of every r-open [resp:  $\alpha$ -open] set is r-open [resp:  $\alpha$ -open].
3. closed [resp: r-closed,  $\alpha$ -closed] if the image of every closed set is closed [resp: r-closed,  $\alpha$ -closed].
4. g-continuous [resp: rg-continuous,  $\alpha g$ -continuous] if the inverse image of every closed set is g-closed. [resp: rg-closed,  $\alpha g$ -closed].

**Definition 2.3:** A function  $f: X \rightarrow Y$  is said to be

1. slightly closed [resp: slightly  $\alpha$ -closed; slightly  $r\alpha$ -closed; slightly r-closed; slightly g-closed] if the image of every clopen set in  $X$  is closed [resp:  $\alpha$ -closed;  $r\alpha$ -closed; r-closed; g-closed] in  $Y$ .
2. almost slightly closed [resp: almost slightly  $\alpha$ -closed; almost slightly  $r\alpha$ -closed; almost slightly r-closed; almost slightly g-closed] if the image of every r-clopen set in  $X$  is closed [resp:  $\alpha$ -closed;  $r\alpha$ -closed; r-closed; g-closed] in  $Y$ .
3. slightly open [resp: slightly  $\alpha$ -open; slightly  $r\alpha$ -open; slightly r-open; slightly g-open] if the image of every clopen set in  $X$  is open [resp:  $\alpha$ -open;  $r\alpha$ -open; r-open; g-open] in  $Y$ .
4. almost slightly open [resp: almost slightly  $\alpha$ -open; almost slightly  $r\alpha$ -open; almost slightly r-open; almost slightly g-open] if the image of every r-clopen set in  $X$  is open [resp:  $\alpha$ -open;  $r\alpha$ -open; r-open; g-open] in  $Y$ .

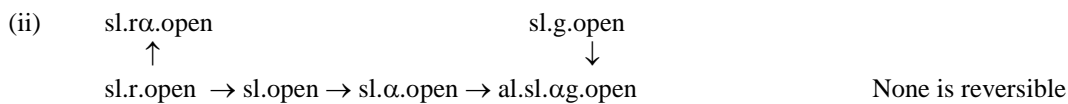

**Definition 2.4:**  $X$  is said to be  $T_{1/2}[r-T_{1/2}]$  if every (regular) generalized closed set is (regular) closed.

### 3. SLIGHTLY $\alpha g$ -OPEN MAPPINGS

**Definition 3.1:** A function  $f: X \rightarrow Y$  is said to be

- i. slightly  $\alpha g$ -open if the image of every clopen set in  $X$  is  $\alpha g$ -open in  $Y$ .
- ii. almost slightly  $\alpha g$ -open if the image of every r-clopen set in  $X$  is  $\alpha g$ -open in  $Y$ .

**Theorem 3.1:** We have the following interrelation among the following slightly open mappings

(iii) If  $\alpha GO(Y) = RO(Y)$ , then the reverse relations hold for all almost slightly open maps.

**Example 1:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\} = \sigma$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is slightly  $\alpha g$ -open and almost slightly  $\alpha g$ -open.

**Example 2:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = a$  and  $f(c) = b$ . Then  $f$  is not slightly  $\alpha g$ -open, slightly open, slightly  $\alpha$ -open, slightly  $r\alpha$ -open, almost slightly  $\alpha g$ -open, almost slightly open, almost slightly  $\alpha$ -open, almost slightly  $r\alpha$ -open and almost slightly g-open and slightly g-open.

**Theorem 3.2:**

- (i) If  $(Y, \sigma)$  is discrete, then  $f$  is [almost] slightly open of all types.
- (ii) If  $f$  is [almost] slightly open and  $g$  is  $\alpha g$ -open then  $gof$  is [almost] slightly  $\alpha g$ -open.
- (iii) If  $f$  is [almost] open and  $g$  is contra  $\alpha g$ -open then  $gof$  is [almost] slightly  $\alpha g$ -open.

**Corollary 3.1:** If  $f$  is [almost] slightly open and  $g$  is [ $r$ -;  $\alpha$ -;  $r\alpha$ -] open then  $gof$  is [almost] slightly  $\alpha g$ -open.

**Corollary 3.2:** If  $f$  is [almost]open and  $g$  is sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] open then  $gof$  is [almost] slightly  $\alpha g$ -open.

**Theorem 3.3:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha g$ -open, then  $f(A^\circ) \subset \alpha g(f(A))^\circ$

**Proof:** Let  $A \subseteq X$  be clopen and  $f: X \rightarrow Y$  is slightly  $\alpha g$ -open gives  $f(A^\circ)$  is  $\alpha g$ -open in  $Y$  and  $f(A^\circ) \subset f(A)$  which in turn gives  $\alpha g(f(A^\circ))^\circ \subset \alpha g(f(A))^\circ$  (1)

Since  $f(A^\circ)$  is  $\alpha g$ -open in  $Y$ ,  $\alpha g(f(A^\circ))^\circ = f(A^\circ)$  (2)

Combining (1) and (2) we have  $f(A^\circ) \subset \alpha g(f(A))^\circ$  for every subset  $A$  of  $X$ .

**Remark 2:** Converse is not true in general

**Corollary 3.3:**

- (i) If  $f: X \rightarrow Y$  is sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] open, then  $f(A^\circ) \subset \alpha g(f(A))^\circ$
- (ii) If  $f: X \rightarrow Y$  is al-sl-[al-sl- $r$ -; al-sl- $\alpha$ -; al-sl- $r\alpha$ -] open, then  $f(A^\circ) \subset \alpha g(f(A))^\circ$

**Theorem 3.4:** If  $f: X \rightarrow Y$  is [almost]slightly  $\alpha g$ -open and  $A \subseteq X$  is [r-clopen]clopen,  $f(A)$  is  $\tau_{\alpha g}$ -open in  $Y$ .

**Proof:** Let  $A \subseteq X$  be clopen and  $f: X \rightarrow Y$  is slightly  $\alpha g$ -open  $\Rightarrow f(A^\circ) \subset \alpha g(f(A))^\circ \Rightarrow f(A) \subset \alpha g(f(A))^\circ$ , since  $f(A) = f(A^\circ)$ . But  $\alpha g(f(A))^\circ \subset f(A)$ . Combining we get  $f(A) = \alpha g(f(A))^\circ$ . Hence  $f(A)$  is  $\tau_{\alpha g}$ -open in  $Y$ .

**Corollary 3.4:**

- (i) If  $f: X \rightarrow Y$  is sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] open, then  $f(A)$  is  $\tau_{\alpha g}$  open in  $Y$  if  $A$  is clopen set in  $X$ .
- (ii) If  $f: X \rightarrow Y$  is al-sl-[al-sl- $r$ -; al-sl- $\alpha$ -; al-sl- $r\alpha$ -]open, then  $f(A)$  is  $\tau_{\alpha g}$  open in  $Y$  if  $A$  is  $r$ -clopen set in  $X$ .

**Theorem 3.5:** If  $\alpha g(A)^\circ = r(A)^\circ$  for every  $A \subseteq Y$ , then the following are equivalent:

- a)  $f: X \rightarrow Y$  is [almost]slightly  $\alpha g$ -open map
- b)  $f(A^\circ) \subset \alpha g(f(A))^\circ$

**Proof:**

(a)  $\Rightarrow$  (b) follows from theorem 3.3.

(b)  $\Rightarrow$  (a) Let  $A$  be any clopen set in  $X$ , then  $f(A) = f(A^\circ) \subset \alpha g(f(A))^\circ$  by hypothesis. We have  $f(A) \subset \alpha g(f(A))^\circ$ , which implies  $f(A)$  is  $\alpha g$ -open. Therefore  $f$  is [almost] slightly  $\alpha g$ -open.

**Theorem 3.6:** If  $\alpha(A)^\circ = r(A)^\circ$  for every  $A \subseteq Y$ , then the following are equivalent:

- a)  $f: X \rightarrow Y$  is [almost]slightly  $\alpha g$ -open map
- b)  $f(A^\circ) \subset \alpha g(f(A))^\circ$

**Proof:**

(a)  $\Rightarrow$  (b) follows from theorem 3.3.

(b)  $\Rightarrow$  (a) Let  $A$  be any clopen set in  $X$ , then  $f(A) = f(A^\circ) \subset \alpha g(f(A))^\circ$  by hypothesis. We have  $f(A) \subset \alpha g(f(A))^\circ$ , which implies  $f(A)$  is  $\alpha g$ -open. Therefore  $f$  is [almost]slightly  $\alpha g$ -open.

**Theorem 3.7:**  $f: X \rightarrow Y$  is [almost]slightly  $\alpha g$ -open iff for each subset  $S$  of  $Y$  and each  $U \in RO(X, f^{-1}(S))$ , there is an  $\alpha g$ -open set  $V$  of  $Y$  such that  $S \subseteq V$  and  $f^{-1}(V) \subseteq U$ .

**Proof:** Assume  $f: X \rightarrow Y$  is slightly  $\alpha g$ -open. Let  $S \subseteq Y$  and  $U \in RO(X, f^{-1}(S))$ . Then  $X-U$  is clopen in  $X$  and  $f(X-U)$  is  $\alpha g$ -open in  $Y$  as  $f$  is slightly  $\alpha g$ -open and  $V = Y - f(X-U)$  is  $\alpha g$ -open in  $Y$ .  $f^{-1}(S) \subseteq U \Rightarrow S \subseteq f(U) \Rightarrow S \subseteq V$  and  $f^{-1}(V) = f^{-1}(Y - f(X-U)) = f^{-1}(Y) - f^{-1}(f(X-U)) = f^{-1}(Y) - (X-U) = X - (X-U) = U$

Conversely Let  $F$  be clopen in  $X \Rightarrow F^c$  is clopen. Then  $f^{-1}(f(F^c)) \subseteq F^c$ . By hypothesis there exists an  $\alpha g$ -open set  $V$  of  $Y$ , such that  $f(F^c) \subseteq V$  and  $f^{-1}(V) \supseteq F^c$  and so  $F \subseteq [f^{-1}(V)]^c$ . Hence  $V^c \subseteq f(F) \subseteq f[f^{-1}(V)^c] \subseteq V^c \Rightarrow f(F) \subseteq V^c \Rightarrow f(F) = V^c$ . Thus  $f(F)$  is  $\alpha g$ -open in  $Y$ . Therefore  $f$  is slightly  $\alpha g$ -open.

**Remark 3:** Composition of two [almost] slightly  $\alpha g$ -open maps is not [almost] slightly  $\alpha g$ -open in general

**Theorem 3.8:** Let  $X, Y, Z$  be topological spaces and every  $\alpha g$ -open set is  $[r$ -clopen] clopen in  $Y$ . Then the composition of two [almost] slightly  $\alpha g$ -open maps is [almost] slightly  $\alpha g$ -open.

**Proof:** (a) Let  $f$  and  $g$  be slightly  $\alpha g$ -open maps. Let  $A$  be any clopen set in  $X \Rightarrow f(A)$  is clopen in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -open in  $Z$ . Therefore  $g \circ f$  is slightly  $\alpha g$ -open.

**Corollary 3.5:** Let  $X, Y, Z$  be topological spaces and

- (i) every  $[r-; \alpha-; r\alpha-]$  open set is  $[r$ -clopen]clopen in  $Y$ . Then the composition of two  $sl$ - $[sl-r-; sl-\alpha-; sl-r\alpha-]$  open maps is [almost] slightly  $\alpha g$ -open.
- (ii) every  $[r-; \alpha-; r\alpha-]$  open set is  $r$ -clopen in  $Y$ . Then the composition of two  $al$ - $sl$ - $[al-sl-r-; al-sl-\alpha-; al-sl-r\alpha-]$  open maps is almost slightly  $\alpha g$ -open.

**Example 3:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a, c\}, Y\}$  and  $\eta = \{\emptyset, \{a\}, \{b, c\}, Z\}$ .  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = b$  and  $f(c) = a$  and  $g: Y \rightarrow Z$  be defined  $g(a) = b, g(b) = a$  and  $g(c) = c$ , then  $g, f$  and  $g \circ f$  are [almost] slightly  $\alpha g$ -open.

**Theorem 3.9:** If  $f: X \rightarrow Y$  is [almost] slightly  $g$ -open [[almost] slightly  $rg$ -open],  $g: Y \rightarrow Z$  is  $\alpha g$ -open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g \circ f$  is [almost] slightly  $\alpha g$ -open.

**Proof:** (a) Let  $A$  be clopen in  $X$ . Then  $f(A)$  is  $g$ -open and so open in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -open in  $Z$  (since  $g$  is  $\alpha g$ -open). Hence  $g \circ f$  is slightly  $\alpha g$ -open.

**Corollary 3.6:** If  $f: X \rightarrow Y$  is [almost] slightly  $g$ -open[[almost] slightly  $rg$ -open],  $g: Y \rightarrow Z$  is  $[r-; \alpha-; r\alpha-]$  open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g \circ f$  is [almost] slightly  $\alpha g$ -open.

**Theorem 3.10:** If  $f: X \rightarrow Y$  is [almost] $g$ -open[[almost] $rg$ -open],  $g: Y \rightarrow Z$  is [almost]slightly  $\alpha g$ -open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g \circ f$  is [almost]slightly  $\alpha g$ -open.

**Proof:** (a) Let  $A$  be clopen in  $X$ . Then  $f(A)$  is  $g$ -open and so open in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -open in  $Z$  (since  $g$  is slightly  $\alpha g$ -open). Hence  $g \circ f$  is slightly  $\alpha g$ -open.

**Corollary 3.7:** If  $f: X \rightarrow Y$  is [almost] $g$ -open[[almost] $rg$ -open],  $g: Y \rightarrow Z$  is  $sl$ - $[sl-r-; sl-\alpha-; sl-r\alpha-]$  open and  $Y$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g \circ f$  is [almost]slightly  $\alpha g$ -open.

**Theorem 3.11:** If  $f: X \rightarrow Y$  is [almost] $sl$ - $g$ -open[[almost] $sl$ - $rg$ -open],  $g: Y \rightarrow Z$  is  $[r-; \alpha-; r\alpha-]$  open and  $Y$  is  $T_{1/2}$ [ $r$ - $T_{1/2}$ ], then  $g \circ f$  is [almost]slightly  $\alpha g$ -open.

**Proof:** Let  $A$  be clopen set in  $X$ , then  $f(A)$  is  $g$ -open in  $Y$  and so open in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $gs$ -open in  $Z$ . Hence  $g \circ f$  is slightly  $\alpha g$ -open [since every  $gs$ -open set is  $\alpha g$ -open].

**Theorem 3.12:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is [almost]slightly  $\alpha g$ -open [[almost]slightly clopen] then the following statements are true.

- a) If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -open.
- b) If  $f$  is  $g$ -continuous [resp:  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -open.

**Proof:** (a) For  $A$  clopen in  $Y, f^{-1}(A)$  open in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -open in  $Z$ . Hence  $g$  is slightly  $\alpha g$ -open. Similarly one can prove the remaining parts and hence omitted.

**Corollary 3.8:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is  $sl$ - $[sl-r-; sl-\alpha-; sl-r\alpha-]$  open then the following statements are true.

- a) If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is [almost]slightly  $\alpha g$ -open.
- b) If  $f$  is  $g$ -continuous[ $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is [almost]slightly  $\alpha g$ -open.

**Theorem 3.13:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is [almost] $\alpha g$ -open then the following statements are true.

- a) If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -open.
- b) If  $f$  is contra- $g$ -continuous[contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r$ - $T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -open.

**Proof:** (a) For  $A$  clopen in  $Y, f^{-1}(A)$  open in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -open in  $Z$ . Hence  $g$  is slightly  $\alpha g$ -open.

**Corollary 3.9:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is  $[r-; \alpha-; r\alpha-]$  open then the following statements are true.

- a) If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -open.
- b) If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -open.

**Theorem 3.14:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -clopen,  $r$ -continuous, slightly  $\alpha g$ -open surjective and  $A^\circ = A$  for every  $\alpha g$ -open set in  $Y$  then  $Y$  is  $\alpha g$ -regular.

**Proof:** Let  $p \in U \in \alpha GO(Y)$ ,  $\exists$  a point  $x \in X \ni f(x) = p$  by surjection. Since  $X$  is  $\alpha g$ -regular and  $f$  is nearly-continuous,  $\exists V \in RC(X) \ni x \in V^\circ \subset V \subset f^{-1}(U)$  which implies  $p \in f(V^\circ) \subset f(V) \subset U$ .....(1)  
for  $f$  is  $\alpha g$ -open,  $f(V^\circ) \subset U$  is  $\alpha g$ -open. By hypothesis  $f(V^\circ)^\circ = f(V^\circ)$  and  $f(V^\circ)^\circ = \{f(V)\}^\circ$ .....(2)

Combining (1) and (2)  $p \in f(V)^\circ \subset f(V) \subset U$  and  $f(V)$  is  $r$ -clopen. Hence  $Y$  is  $\alpha g$ -regular.

**Corollary 3.10:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -clopen,  $r$ -continuous, slightly  $\alpha g$ -open, surjective and  $A^\circ = A$  for every  $r$ -clopen set in  $Y$  then  $Y$  is  $\alpha g$ -regular.

**Theorem 3.15:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha g$ -open and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -open.

**Proof:** Let  $F$  be an clopen set in  $A$ . Then  $F = A \cap E$  for some clopen set  $E$  of  $X$  and so  $F$  is clopen in  $X \Rightarrow f(A)$  is  $\alpha g$ -open in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is slightly  $\alpha g$ -open.

**Theorem 3.16:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha g$ -open,  $X$  is  $rT_{1/2}$  and  $A$  is  $rg$ -open set of  $X$  then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -open.

**Proof:** Let  $F$  be a clopen set in  $A$ . Then  $F = A \cap E$  for some clopen set  $E$  of  $X$  and so  $F$  is clopen in  $X \Rightarrow f(A)$  is  $\alpha g$ -open in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is slightly  $\alpha g$ -open.

**Corollary 3.11:**

- (i) If  $f: X \rightarrow Y$  is  $sl$ -[ $sl$ - $r$ -;  $sl$ - $\alpha$ -;  $sl$ - $r\alpha$ -] open and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -open.
- (ii) If  $f: X \rightarrow Y$  is  $al$ - $sl$ -[ $al$ - $sl$ - $r$ -;  $al$ - $sl$ - $\alpha$ -;  $al$ - $sl$ - $r\alpha$ -] open and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost slightly  $\alpha g$ -open.

**Theorem 3.17:** If  $f_i: X_i \rightarrow Y_i$  be [almost] slightly  $\alpha g$ -open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ . Then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is [almost] slightly  $\alpha g$ -open.

**Proof:** Let  $U_1 \times U_2 \subseteq X_1 \times X_2$  where  $U_i$  is clopen in  $X_i$  for  $i = 1, 2$ . Then  $f(U_1 \times U_2) = f_1(U_1) \times f_2(U_2)$  is  $\alpha g$ -open set in  $Y_1 \times Y_2$ . Hence  $f$  is slightly  $\alpha g$ -open.

**Corollary 3.12:**

- (i) If  $f_i: X_i \rightarrow Y_i$  be  $sl$ -[ $sl$ - $r$ -;  $sl$ - $\alpha$ -;  $sl$ - $r\alpha$ -] open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is [almost] slightly  $\alpha g$ -open.
- (ii) If  $f_i: X_i \rightarrow Y_i$  be  $al$ - $sl$ -[ $al$ - $sl$ - $r$ -;  $al$ - $sl$ - $\alpha$ -;  $al$ - $sl$ - $r\alpha$ -] open for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is almost slightly  $\alpha g$ -open.

**Theorem 3.18:** Every [almost] $\alpha g$ -open and [almost]contra  $\alpha g$ -closed is [almost] slightly  $\alpha g$ -open map but not conversely.

**Proof:** Let  $A$  be any clopen set in  $X$ , then  $A$  is both open and closed in  $X$ . For,  $f$  is  $\alpha g$ -open and contra  $\alpha g$ -closed,  $f(A)$  is  $\alpha g$ -open. Hence  $f$  is slightly  $\alpha g$ -open.

**Theorem 3.19:** Every slightly  $\alpha g$ -open map is almost slightly  $\alpha g$ -open map but not conversely.

**Theorem 3.20:** Every [almost] $\alpha g$ -open and [almost] contra  $\alpha g$ -closed map is [almost] slightly  $\alpha g$ -open map but not conversely.

**Proof:** Let  $A$  be any  $r$ -clopen set in  $X$ , then  $A$  is both  $r$ -open and  $r$ -closed in  $X$ . For,  $f$  is almost  $\alpha g$ -open and almost contra  $\alpha g$ -closed,  $f(A)$  is  $\alpha g$ -open. Hence  $f$  is almost slightly  $\alpha g$ -open.

**Example 4:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ ;  $f: X \rightarrow Y$  be defined  $f(a) = c$ ,  $f(b) = b$  and  $f(c) = a$ , then  $f$  is [almost]slightly  $\alpha g$ -open but not  $\alpha g$ -open and contra  $\alpha g$ -closed.

**Note 1:**

$$\begin{array}{ccc}
 \text{(ii)} & \alpha g.\text{open} & \rightarrow & \text{sl.}\alpha g.\text{open} & \leftarrow & \text{c.}\alpha g.\text{closed} \\
 & \uparrow & & & & \downarrow \\
 & \text{al.}\alpha g.\text{open} & \rightarrow & \text{al.sl.}\alpha g.\text{open} & \leftarrow & \text{al.c.}\alpha g.\text{closed}
 \end{array}$$

None is reversible

**Corollary 3.13:**

- (i) If  $f$  is  $[r-; \alpha-; r\alpha-]$ open and  $[c-r-; c-\alpha-; c-r\alpha-]$  closed then  $f$  is [almost] slightly  $\alpha g$ -open.
- (ii) If  $f$  is  $[\text{al-}; \text{al-}r-; \text{al-}\alpha-; \text{al-}r\alpha-]$ open and  $[c--; c-r-; c-\alpha-; c-r\alpha-]$ closed then  $f$  is slightly  $\alpha g$ -open.

**Corollary 3.14:**

- (i) If  $f$  is open and  $g$  is  $[\text{sl-}r-; \text{sl-}\alpha-; \text{sl-}r\alpha-]$  open then  $gof$  is [almost] slightly  $\alpha g$ -open.
- (ii) If  $f$  is open and  $g$  is  $\text{al-sl-}[\text{al-sl-}r-; \text{al-sl-}\alpha-; \text{al-sl-}r\alpha-]$  open then  $gof$  is almost slightly  $\alpha g$ -open.

#### 4. SLIGHTLY $\alpha g$ -CLOSED MAPPINGS

**Definition 4.1:** A function  $f: X \rightarrow Y$  is said to be

- i. slightly  $\alpha g$ -closed if the image of every clopen set in  $X$  is  $\alpha g$ -closed in  $Y$ .
- ii. almost slightly  $\alpha g$ -closed if the image of every  $r$ -clopen set in  $X$  is  $\alpha g$ -closed in  $Y$ .

**Theorem 4.1:** We have the following interrelation among the following slightly closed mappings

$$\begin{array}{ccc}
 \text{(i)} & \text{al.sl.r}\alpha.\text{closed} & & \text{al.sl.g.closed} \\
 & \uparrow & & \downarrow \\
 & \text{al.sl.r.closed} & \rightarrow & \text{al.sl.closed} & \rightarrow & \text{al.sl.}\alpha.\text{closed} & \rightarrow & \text{al.sl.}\alpha g.\text{closed}
 \end{array}$$

None is reversible

$$\begin{array}{ccc}
 \text{(ii)} & \text{sl.r}\alpha.\text{closed} & & \text{sl.g.closed} \\
 & \uparrow & & \downarrow \\
 & \text{sl.r.closed} & \rightarrow & \text{sl.closed} & \rightarrow & \text{sl.}\alpha.\text{closed} & \rightarrow & \text{al.sl.}\alpha g.\text{closed}
 \end{array}$$

None is reversible

(iii) If  $\alpha GC(Y) = RC(Y)$ , then the reverse relations hold for all almost slightly closed maps.

$$\begin{array}{ccc}
 \text{(c)} & \text{al. sl.r}\alpha.\text{closed} & & \text{al.sl.g.closed} \\
 & \uparrow \downarrow & & \uparrow \downarrow \\
 & \text{al.sl.r.closed} & \leftrightarrow & \text{al.sl.closed} & \leftrightarrow & \text{al.sl.}\alpha.\text{closed} & \leftrightarrow & \text{al.sl.}\alpha g.\text{closed}
 \end{array}$$

$$\begin{array}{ccc}
 \text{(d)} & \text{sl.r}\alpha.\text{closed} & & \text{sl.g.closed} \\
 & \uparrow \downarrow & & \uparrow \downarrow \\
 & \text{sl.r.closed} & \leftrightarrow & \text{sl.closed} & \leftrightarrow & \text{sl.}\alpha.\text{closed} & \leftrightarrow & \text{sl.}\alpha g.\text{closed}
 \end{array}$$

**Example 3:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\} = \sigma$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c$ ,  $f(b) = a$  and  $f(c) = b$ . Then  $f$  is slightly  $\alpha g$ -closed and almost slightly  $\alpha g$ -closed.

**Example 4:** Let  $X = Y = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{b, c\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ . Let  $f: X \rightarrow Y$  be defined  $f(a) = c$ ,  $f(b) = a$  and  $f(c) = b$ . Then  $f$  is not slightly  $\alpha g$ -closed, slightly closed, slightly  $\alpha$ -closed, slightly  $r\alpha$ -closed, almost slightly  $\alpha g$ -closed, almost slightly closed, almost slightly  $\alpha$ -closed, almost slightly  $r\alpha$ -closed and almost slightly  $g$ -closed and slightly  $g$ -closed.

**Theorem 4.2:**

- (i) If  $(Y, \sigma)$  is discrete, then  $f$  is [almost]slightly closed of all types.
- (ii) If  $f$  is [almost] slightly closed and  $g$  is  $\alpha g$ -closed then  $gof$  is [almost] slightly  $\alpha g$ -closed.
- (iii) If  $f$  is [almost] closed and  $g$  is contra  $\alpha g$ -closed then  $gof$  is [almost] slightly  $\alpha g$ -closed.

**Corollary 4.1:**

- (i) If  $f$  is [almost] slightly closed and  $g$  is  $[r-; \alpha-; r\alpha-]$  closed then  $gof$  is [almost] slightly  $\alpha g$ -closed.
- (ii) If  $f$  is closed[ $r$ -closed] and  $g$  is  $\text{sl-}[\text{sl-}r-; \text{sl-}\alpha-; \text{sl-}r\alpha-]$  closed then  $gof$  is slightly  $\alpha g$ -closed.
- (iii) If  $f$  is almost closed [almost  $r$ -closed] and  $g$  is  $\text{sl-}[\text{sl-}r-; \text{sl-}\alpha-; \text{sl-}r\alpha-]$  closed then  $gof$  is almost slightly  $\alpha g$ -closed.

**Theorem 4.3:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha$ -closed, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:** Let  $A \subset X$  be  $r$ -clopen and  $f: X \rightarrow Y$  is slightly  $\alpha$ -closed gives  $f(\text{cl}(A))$  is  $\alpha g$ -closed in  $Y$  and  $f(A) \subset f(\text{cl}(A))$  which in turn gives  $\alpha g(\text{cl}(f(A))) \subset \alpha g(\text{cl}(f(\text{cl}(A)))) \dots \dots \dots (1)$

Since  $f(\text{cl}(A))$  is  $\alpha g$ -closed in  $Y$ ,  $\alpha g(\text{cl}(f(\text{cl}(A)))) = f(\text{cl}(A)) \dots \dots \dots (2)$

From (1) and (2) we have  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  for every subset  $A$  of  $X$ .

**Remark 2:** Converse is not true in general

**Corollary 4.2:**

- (i) If  $f: X \rightarrow Y$  is  $sl$ -[ $sl-r$ ;  $sl-\alpha$ ;  $sl-r\alpha$ ] closed, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$
- (ii) If  $f: X \rightarrow Y$  is  $al$ - $sl$ -[ $al$ - $sl-r$ ;  $al$ - $sl-\alpha$ ;  $al$ - $sl-r\alpha$ ] closed, then  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Theorem 4.4:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha$ -closed and  $A \subset X$  is [ $r$ -]clopen,  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Proof:** Let  $A \subset X$  be clopen and  $f: X \rightarrow Y$  is slightly  $\alpha$ -closed implies  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$  which in turn implies  $\alpha g(\text{cl}(f(A))) \subset f(A)$ , since  $f(A) = f(\text{cl}(A))$ . But  $f(A) \subset \alpha g(\text{cl}(f(A)))$ . Combaining we get  $f(A) = \alpha g(\text{cl}(f(A)))$ . Hence  $f(A)$  is  $\tau_{\alpha g}$ -closed in  $Y$ .

**Corollary 4.3:**

- (i) If  $f: X \rightarrow Y$  is  $sl$ -[ $sl-r$ ;  $sl-\alpha$ ;  $sl-r\alpha$ ] closed, then  $f(A)$  is  $\tau_{\alpha g}$  closed in  $Y$  if  $A$  is clopen set in  $X$ .
- (ii) If  $f: X \rightarrow Y$  is  $al$ - $sl$ -[ $al$ - $sl-r$ ;  $al$ - $sl-\alpha$ ;  $al$ - $sl-r\alpha$ ] closed, then  $f(A)$  is  $\tau_{\alpha g}$  closed in  $Y$  if  $A$  is  $r$ -clopen set in  $X$ .

**Theorem 4.5:** If  $\alpha g(\text{cl}(f(A))) = r\text{cl}(A)$  for every  $A \subset Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is [almost]slightly  $\alpha$ -closed map
- b)  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:**

(a)  $\Rightarrow$  (b) follows from theorem 4.3

(b)  $\Rightarrow$  (a) Let  $A$  be any clopen set in  $X$ , then  $f(A) = f(\text{cl}(A)) \supset \alpha g(\text{cl}(f(A)))$  by hypothesis. We have  $f(A) \subset \alpha g(\text{cl}(f(A)))$ .

Combining we get  $f(A) = \alpha g(\text{cl}(f(A))) = r\text{cl}(f(A))$ [ by given condition] which implies  $f(A)$  is clopen and hence  $\alpha g$ -closed. Thus  $f$  is slightly  $\alpha$ -closed.

**Theorem 4.6:** If  $\alpha(\text{cl}(A)) = r\text{cl}(A)$  for every  $A \subset Y$  and  $X$  is discrete space, then the following are equivalent:

- a)  $f: X \rightarrow Y$  is [almost] slightly  $\alpha$ -closed map
- b)  $\alpha g(\text{cl}(f(A))) \subset f(\text{cl}(A))$

**Proof:**

(a)  $\Rightarrow$  (b) follows from theorem 4.3

(b)  $\Rightarrow$  (a) Let  $A$  be any clopen set in  $X$ , then  $f(A) = f(\text{cl}(A)) \supset \alpha g(\text{cl}(f(A)))$  by hypothesis. We have  $f(A) \subset \alpha g(\text{cl}(f(A)))$ . Combining we get  $f(A) = \alpha g(\text{cl}(f(A))) = r\text{cl}(f(A))$ [ by given condition] which implies  $f(A)$  is clopen and hence  $\alpha g$ -closed. Thus  $f$  is slightly  $\alpha$ -closed.

**Theorem 4.7:**  $f: X \rightarrow Y$  is [almost]slightly  $\alpha$ -closed iff for each subset  $S$  of  $Y$  and each  $U \in RC(X, f^{-1}(S))$ , there is an  $\alpha g$ -closed set  $V$  of  $Y$  such that  $S \subseteq V$  and  $f^{-1}(V) \subseteq U$ .

**Proof:** Assume  $f: X \rightarrow Y$  is slightly  $\alpha$ -closed. Let  $S \subseteq Y$  and  $U \in RC(X, f^{-1}(S))$ . Then  $X-U$  is clopen in  $X$  and  $f(X-U)$  is  $\alpha g$ -closed in  $Y$  as  $f$  is slightly  $\alpha$ -closed and  $V = Y - f(X-U)$  is  $\alpha g$ -closed in  $Y$ .  $f^{-1}(S) \subseteq U \Rightarrow S \subseteq f(U) \Rightarrow S \subseteq V$  and  $f^{-1}(V) = f^{-1}(Y - f(X-U)) = f^{-1}(Y) - f^{-1}(f(X-U)) = f^{-1}(Y) - (X-U) = X - (X-U) = U$

Conversely Let  $F$  be clopen in  $X \Rightarrow F^c$  is clopen. Then  $f^{-1}(f(F^c)) \subseteq F^c$ . By hypothesis there exists an  $\alpha g$ -closed set  $V$  of  $Y$ , such that  $f(F^c) \subseteq V$  and  $f^{-1}(V) \supset F^c$  and so  $F \subseteq [f^{-1}(V)]^c$ . Hence  $V^c \subseteq f(F) \subseteq f[f^{-1}(V)^c] \subseteq V^c \Rightarrow f(F) \subseteq V^c \Rightarrow f(F) = V^c$ . Thus  $f(F)$  is  $\alpha g$ -closed in  $Y$ . Therefore  $f$  is slightly  $\alpha$ -closed.

**Remark 3:** Composition of two [almost] slightly  $\alpha$ -closed maps is not [almost] slightly  $\alpha$ -closed in general

**Theorem 4.8:** Let  $X, Y, Z$  be topological spaces and every  $\alpha g$ -closed set is [r-clopen]clopen in  $Y$ . Then the composition of two [almost] slightly  $\alpha g$ -closed maps is [almost] slightly  $\alpha g$ -closed.

**Proof:** (a) Let  $f$  and  $g$  be slightly  $\alpha g$ -closed maps. Let  $A$  be any clopen set in  $X \Rightarrow f(A)$  is  $r$ -closed in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$ . Therefore  $g \circ f$  is slightly  $\alpha g$ -closed.

**Corollary 4.4:** Let  $X, Y, Z$  be topological spaces and

- (i) every  $[r-; \alpha-; r\alpha-]$  closed set is [r-clopen]clopen in  $Y$ . Then the composition of two sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] closed maps is [almost] slightly  $\alpha g$ -closed.
- (ii) every  $[r-; \alpha-; r\alpha-]$  closed set is  $r$ -clopen in  $Y$ . Then the composition of two al-sl-[al-sl- $r$ -; al-sl- $\alpha$ -; al-sl- $r\alpha$ -] closed maps is almost slightly  $\alpha g$ -closed.

**Example 5:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a, c\}, Y\}$  and  $\eta = \{\emptyset, \{a\}, \{b, c\}, Z\}$ .  $f: X \rightarrow Y$  be defined  $f(a) = c, f(b) = b$  and  $f(c) = a$  and  $g: Y \rightarrow Z$  be defined  $g(a) = b, g(b) = a$  and  $g(c) = c$ , then  $g, f$  and  $g \circ f$  are slightly  $\alpha g$ -closed.

**Theorem 4.9:** If  $f: X \rightarrow Y$  is [almost] slightly  $g$ -closed[[almost] slightly  $rg$ -closed],  $g: Y \rightarrow Z$  is  $\alpha g$ -closed and  $Y$  is  $T_{1/2}[r-T_{1/2}]$  then  $g \circ f$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** (a) Let  $A$  be clopen in  $X$ . Then  $f(A)$  is  $g$ -closed and so closed in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$  (since  $g$  is  $\alpha g$ -closed). Hence  $g \circ f$  is slightly  $\alpha g$ -closed.

**Corollary 4.5:** If  $f: X \rightarrow Y$  is [almost] slightly  $g$ -closed[[almost] slightly  $rg$ -closed],  $g: Y \rightarrow Z$  is  $[r-; \alpha-; r\alpha-]$  closed and  $Y$  is  $T_{1/2}[r-T_{1/2}]$  then  $g \circ f$  is [almost] slightly  $\alpha g$ -closed.

**Theorem 4.10:** If  $f: X \rightarrow Y$  is [almost] $g$ -closed[[almost] $rg$ -closed],  $g: Y \rightarrow Z$  is  $\alpha g$ -closed and  $Y$  is  $T_{1/2}[r-T_{1/2}]$  then  $g \circ f$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** (a) Let  $A$  be clopen in  $X$ . Then  $f(A)$  is  $g$ -closed and so closed in  $Y$  as  $Y$  is  $T_{1/2} \Rightarrow g(f(A)) = g \circ f(A)$  is  $\alpha g$ -closed in  $Z$  (since  $g$  is contra  $\alpha g$ -closed). Hence  $g \circ f$  is slightly  $\alpha g$ -closed.

**Corollary 4.6:** If  $f: X \rightarrow Y$  is [almost] $g$ -closed[[almost] $rg$ -closed],  $g: Y \rightarrow Z$  is sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] closed and  $Y$  is  $T_{1/2}[r-T_{1/2}]$  then  $g \circ f$  is [almost] slightly  $\alpha g$ -closed.

**Theorem 4.11:** If  $f: X \rightarrow Y$  is [almost]sl- $g$ -closed[[almost]sl- $rg$ -closed],  $g: Y \rightarrow Z$  is  $[r-; \alpha-; r\alpha-]$  closed and  $Y$  is  $T_{1/2}[r-T_{1/2}]$ , then  $g \circ f$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** Let  $A$  be clopen set in  $X$ , then  $f(A)$  is  $g$ -closed in  $Y$  and so closed in  $Y$  (by assumption)  $\Rightarrow g(f(A)) = g \circ f(A)$  is  $gs$ -closed in  $Z$ . Hence  $g \circ f$  is slightly  $\alpha g$ -closed [since every  $gs$ -closed set is  $\alpha g$ -closed].

**Theorem 4.12:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is [almost] slightly  $\alpha g$ -closed [[almost] slightly  $r$ -closed] then the following statements are true.

- a) If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -closed.
- b) If  $f$  is  $g$ -continuous[resp:  $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r-T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** (a) For  $A$  clopen in  $Y, f^{-1}(A)$  closed in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is slightly  $\alpha g$ -closed. Similarly one can prove the remaining parts and hence omitted.

**Corollary 4.7:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is sl-[sl- $r$ -; sl- $\alpha$ -; sl- $r\alpha$ -] closed then the following statements are true.

- a) If  $f$  is continuous [ $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -closed.
- b) If  $f$  is  $g$ -continuous [ $rg$ -continuous], surjective and  $X$  is  $T_{1/2}[r-T_{1/2}]$  then  $g$  is [almost] slightly  $\alpha g$ -closed.

**Theorem 4.13:** If  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two mappings such that  $g \circ f$  is [almost] $\alpha g$ -closed then the following statements are true.

- a) If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -closed.
- b) If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [resp:  $r-T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** (a) For  $A$  clopen in  $Y, f^{-1}(A)$  closed in  $X \Rightarrow (g \circ f)(f^{-1}(A)) = g(A)$   $\alpha g$ -closed in  $Z$ . Hence  $g$  is slightly  $\alpha g$ -closed.

**Corollary 4.8:** If  $f: X \rightarrow Y$ ,  $g: Y \rightarrow Z$  be two mappings such that  $gof$  is  $[r-; \alpha-; r\alpha-]$  closed then the following statements are true.

- If  $f$  is contra-continuous [contra- $r$ -continuous] and surjective then  $g$  is [almost] slightly  $\alpha g$ -closed.
- If  $f$  is contra- $g$ -continuous [contra- $rg$ -continuous], surjective and  $X$  is  $T_{1/2}$  [ $r$ - $T_{1/2}$ ] then  $g$  is [almost] slightly  $\alpha g$ -closed.

**Theorem 4.14:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, [almost] slightly  $\alpha g$ -closed surjection and  $\bar{A} = A$  for every  $\alpha g$ -closed set in  $Y$ , then  $Y$  is  $\alpha g$ -regular.

**Proof:** Let  $p \in U \in \alpha gO(Y)$ . Then there exists a point  $x \in X$  such that  $f(x) = p$  as  $f$  is surjective. Since  $X$  is  $\alpha g$ -regular and  $f$  is  $r$ -continuous there exists  $V \in RO(X)$  such that  $x \in V \subseteq \bar{V} \subseteq f^{-1}(U)$  which implies  $p \in f(V) \subseteq f(\bar{V}) \subseteq f(f^{-1}(U)) = U \rightarrow (1)$

Since  $f$  is  $\alpha g$ -closed,  $f(\bar{V}) \subseteq U$ , By hypothesis  $\overline{f(\bar{V})} = f(\bar{V})$  and  $\overline{f(\bar{V})} = \overline{f(\bar{V})} \rightarrow (2)$

By (1) & (2) we have  $p \in f(V) \subseteq f(\bar{V}) \subseteq U$  and  $f(V)$  is  $\alpha g$ -closed. Hence  $Y$  is  $\alpha g$ -regular.

**Corollary 4.9:** If  $X$  is  $\alpha g$ -regular,  $f: X \rightarrow Y$  is  $r$ -closed, nearly-continuous, [almost] slightly  $\alpha g$ -closed surjection and  $\bar{A} = A$  for every  $r$ -closed set in  $Y$  then  $Y$  is  $\alpha g$ -regular.

**Theorem 4.15:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha g$ -closed and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** Let  $F$  be a clopen set in  $A$ . Then  $F = \Delta E$  for some clopen set  $E$  of  $X$  and so  $F$  is clopen in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is slightly  $\alpha g$ -closed.

**Theorem 4.16:** If  $f: X \rightarrow Y$  is [almost] slightly  $\alpha g$ -closed,  $X$  is  $rT_{1/2}$  and  $A$  is  $rg$ -closed set of  $X$  then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** Let  $F$  be a clopen set in  $A$ . Then  $F = \Delta E$  for some clopen set  $E$  of  $X$  and so  $F$  is clopen in  $X \Rightarrow f(A)$  is  $\alpha g$ -closed in  $Y$ . But  $f(F) = f_A(F)$ . Therefore  $f_A$  is slightly  $\alpha g$ -closed.

**Corollary 4.10:**

- If  $f: X \rightarrow Y$  is  $sl$ - $[sl-r-; sl-\alpha-; sl-r\alpha-]$  closed and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is [almost] slightly  $\alpha g$ -closed.
- If  $f: X \rightarrow Y$  is  $al$ - $sl$ - $[al-sl-r-; al-sl-\alpha-; al-sl-r\alpha-]$  closed and  $A \in RC(X)$ , then  $f_A: (X, \tau(A)) \rightarrow (Y, \sigma)$  is almost slightly  $\alpha g$ -closed.

**Theorem 4.17:** If  $f_i: X_i \rightarrow Y_i$  be [almost] slightly  $\alpha g$ -closed for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ . Then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is [almost] slightly  $\alpha g$ -closed.

**Proof:** Let  $U_1 \times U_2 \subseteq X_1 \times X_2$  where  $U_i$  is clopen in  $X_i$  for  $i = 1, 2$ . Then  $f(U_1 \times U_2) = f_1(U_1) \times f_2(U_2)$  is  $\alpha g$ -closed set in  $Y_1 \times Y_2$ . Hence  $f$  is slightly  $\alpha g$ -closed.

**Corollary 4.11:**

- If  $f_i: X_i \rightarrow Y_i$  be  $sl$ - $[sl-r-; sl-\alpha-; sl-r\alpha-]$  closed for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is [almost] slightly  $\alpha g$ -closed.
- If  $f_i: X_i \rightarrow Y_i$  be  $al$ - $sl$ - $[al-sl-r-; al-sl-\alpha-; al-sl-r\alpha-]$  closed for  $i = 1, 2$ . Let  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  be defined as  $f(x_1, x_2) = (f_1(x_1), f_2(x_2))$ , then  $f: X_1 \times X_2 \rightarrow Y_1 \times Y_2$  is almost slightly  $\alpha g$ -closed.

**Theorem 4.18:** Every [almost]  $\alpha g$ -closed and [almost] contra  $\alpha g$ -open is [almost] slightly  $\alpha g$ -closed map but not conversely.

**Proof:** Let  $A$  be any clopen set in  $X$ , then  $A$  is both open and closed in  $X$ . For,  $f$  is  $\alpha g$ -closed and contra  $\alpha g$ -open,  $f(A)$  is  $\alpha g$ -closed. Hence  $f$  is slightly  $\alpha g$ -closed.

**Example 6:** Let  $X = Y = Z = \{a, b, c\}$ ;  $\tau = \{\emptyset, \{a\}, \{a, b\}, X\}$ ;  $\sigma = \{\emptyset, \{a\}, \{b\}, \{a, b\}, Y\}$ ,  $f: X \rightarrow Y$  be defined  $f(a) = c$ ,  $f(b) = b$  and  $f(c) = a$ , then  $f$  is [almost] slightly  $\alpha g$ -closed but not  $\alpha g$ -closed and contra  $\alpha g$ -open.

**Note-2:**

**Theorem 4.19:** Every slightly  $\alpha g$ -closed map is almost slightly  $\alpha g$ -closed map but not conversely.

**Corollary 4.12:**

- (i) If  $f$  is  $[r-; \alpha-; r\alpha-]$ closed and  $[c-r-; c-\alpha-; c-r\alpha-]$ open then  $f$  is [almost]slightly  $\alpha g$ -closed.
- (ii) If  $f$  is  $[\text{al-}; \text{al-}r-; \text{al-}\alpha-; \text{al-}r\alpha-]$ closed and  $[c-; c-r-; c-\alpha-; c-r\alpha-]$ open then  $f$  is slightly  $\alpha g$ -closed.

**Corollary 4.13:**

- (i) If  $f$  is closed and  $g$  is  $[\text{sl-}r-; \text{sl-}\alpha-; \text{sl-}r\alpha-]$  closed then  $gof$  is [almost] slightly  $\alpha g$ -closed.
- (ii) If  $f$  is closed and  $g$  is  $\text{al-sl-}[\text{al-sl-}r-; \text{al-sl-}\alpha-; \text{al-sl-}r\alpha-]$  closed then  $gof$  is almost slightly  $\alpha g$ -closed.

**CONCLUSION**

In this paper we introduced the concept of slightly  $\alpha g$ -open, slightly  $\alpha g$ -closed, almost slightly  $\alpha g$ -open and almost slightly  $\alpha g$ -closed mappings, studied their basic properties and the interrelationship between other slightly open and slightly closed maps.

**ACKNOWLEDGEMENT**

The Authors would like to thank the referees for their critical comments, suggestions and corrections towards the development of the paper.
